REARVIEW MIRROR WITH DISPLAY

ABSTRACT OF THE DISCLOSURE

5 A mirror includes a housing, a mirror subassembly including a reflector layer with
a portion defining an opening, and an indicia panel covering the opening and configured to form a
visual display. At least one light source is positioned in the housing to pass light through the
indicia panel and the opening of the mirror subassembly to selectively illuminate the visual
display. The at least one light source emits a light matched in color to the indicia panel so that a
maximum of light from the at least one light source passes through the indicia panel and is visible
to a vehicle driver. Optimally, the light sources emit an amber colored light, and the indicia
10 panel includes a diffusing layer also having an amber color.
